CAPALYTIC ACTIVITY: 5,10-methylenetetrahydrofolate + 3-methyl-2-
oxobutanoate = tetrahydrofolate + 2-dehydropantoate.

PARTHWAY: Pantothenate blosynthesis; first branch; first step.

SIMILARITY: BELONGS TO THE PAND FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                PD004277; Ribosomal_L17; 1.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Amplified fragments were ligated into pTTQ18 vector, which contains the hybrid trp-lac (tac) promoter. An amplification/scloction protocol was used to isolate clone 4B containing a mutated Tag DNAP gene (mutTag) (sequence given in AAQ80746) having normal 5 nuclease activity but less than 1% of the wt Tag DNAP activity. mutTag was cut from pTTQ18 by EcoRI-SalI digestion and cloned into pET-3c.

Thermus aquaticus (Taq) DNA polymerase was amplified using two primers (ART27679, ART27680). The Taq polymerase DNA was inserted into the BamHI restriction site of the expression vector pET-3c and mutant genes were created from that construct. This mutant was created after the material distriction of the construct.
                                                                                                                                                    . No.:
                                                                                                                                                                                                                                                                               genes were created from that construct. This mutant was created after the vector was digested with BstXI and BamHI. The DNA was then treated with the Klenow fragment of DNAPEC1 to trim both 3' overhangs to blunt ends which were then ligated together, resulting in an in frame deletion of 903 nucleotides. The resulting mutant

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               polymerases are useful in many recombinant DNA techniques, esp. nucleic acid amplification by PCR, self-sustained sequence replication (SSR) and high temp. DNA sequencing. The absence of 5'-3' nuclease activity may facilitate higher sensitivity allelic discrimination in a combined polymerase ligase chain reaction (PLCR) assay. An enhanced amt. of 5'-3' exonuclease activity may be desirable
                                                                                                                                                                                                        1810 CTCTCCCAGGAGCTCTCCATCCCCTACGAGGAG 1842
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                detection of a target nucleic acid sequence. Mutation of the DNA encoding particular regions of the enzymes can be used to prepare a range of recombinant proteins having 5'-3' exonuclease activity to a complete lack of activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The sequence is that of Thermus species sps17 polymerase DNA which has been mutated. The mutation designated ps9802-73 causes the polymerase enzyme produced to exhibit a different ant. of 5'-3' exonuclease activity than the native enzyme. Thermostable DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Thermostable DNA polymerases with altered 5'-3' exo nuclease activity - having conserved regions mutated or deleted, for use in e.g. PCR, sequencing and detection assays
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       old_sequence

                                                                                                                                                                                        1168 CTCTCCCAGGAGCTCTCCCATCCCCTACGAGGAG 1200
                                                                                                                                                                                                                                                                                                                                                                                        detection of a target nucleic acid sequence. Mutation of the DNA encoding particular regions of the enzymes can be used to prepare a range of recombinant proteins having 5'-3' exonuclease activity to a complete lack of activity.
                     Thermus species sps17
                                             5'-3'; exonuclease; PCR; amplification; SSR; sequencing; PLCR;
                                                                    Mutant thermostable DNA polymerase pSPSd2-199.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           has been mutated. The mutation designated pSPSdA288 causes the polymerase enzyme produced to exhibit a different amt. of 5'-3' exonuclease activity than the native enzyme. Thermostable DNA polymerases are useful in many recombinant DNA techniques, esp.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         28-SEP-1990;
                                                                                                                                         AAQ24009 standard; DNA; 1899 BP
                                                                                                                                                                                                                                                                                                                                                        Sequence 1635 BP; 267 A; 572 C; 559 G; 237 T; 0 other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                   discrimination in a combined polymerase ligase chain reaction (PLCR) assay. An enhanced amt. of 5'-3' exonuclease activity may be desirable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           nucleic acid amplification by PCR, self-sustained sequence replication (SSR) and high temp. DNA sequencing. The absence of 5'-3' nuclease activity may facilitate higher sensitivity allelic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Claim 11; Page 59; 185pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     detection of a target nucleic acid sequence. Mutation of the DNA encoding particular regions of the enzymes can be used to prepare a range of recombinant proteins having 5'-3' exonuclease activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             nucleic acid amplification by PCR, self-sustained sequence replication (SSR) and high temp. DNA sequencing. The absence of 5'-3' nuclease activity may facilitate higher sensitivity allelic discrimination in a combined polymerase ligase chain reaction (PLCR) assay. An enhanced amt. of 5'-3' exonuclease activity may be desirable in enzymes used in homogeneous assays for the amplification and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The sequence is that of Thermus species sps17 polymerase DNA which has been mutated. The mutation designated psp82d-199 causes the polymerase enzyme produced to exhibit a different amt. of 5'-3' exonuclease activity than the native enzyme. Thermostable DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                old_sequence
Mutant thermostable DNA polymerase pSPSd2~151.
                                                                                                                                                     AAQ24008 standard; DNA; 2043 BP

The methods are used for the specific detection of nucleic acid sequences, via a cleavage-based procedure, but without the need for amplification of target sequences. Thermostable polymerases, altered to have nuclease, but not polymerase activity are preferably used due to their specificity. The cleavage product specifically formed is detected, preferably by the use of radioactively labelled oligonucleotides. These

5' Nuclease(s) derived from thermostable DNA polymerase(s) - cleavage activity with reduced synthetic ability, used for detection of specific target sequences.
                                                                                                                                                                                                                                                                                                                                                                                      3316 CTCTCCCAGGAGCTCTCCATCCCCTACGAGGAG
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This sequence encodes the thermostable polymerase of Thermus species sps17. It may be mutated to encode an Asp residue at position 43 instead of the wild type Gly residue. This substitution is shown to result in a 100 fold decrease in the 5'-3' exonuclease activity with no change to the polymerase activity of the enzyme.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            DNA for Thermus species sps17 DNA polymerase - modified to encode an N-terminal deletion to reduce 5'\cdot 3' exo:nuclease activity

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The Taq DNA-polymerase (DNAP) gene was amplified by PCR. Amplified fragments were ligated into pTTQ18 vector, which contains the hybrid trp-lac (tac) promoter. An amplification/selection protocol was used to isolate clone 4B containing a mutated Taq DNAP gene (mutTaq) (sequence given in AAQ80746) having normal 5' nucleas activity but less than 18 of the wt Taq DNAP activity. mutTaq was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         cut from pTTQ18 by EcoRI-Sall digestion and cloned into pET-3c. Thus clone was digested with BstXI and Bam#I. The DNA was treated with DNA;ECI Klenow fragment and dnPbs, blu-t-ended and religated resulting in an in-frame deletion of 903 nucleotides. The DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1133 CTCTCCCAGGAGCTAGCCATCCCTTACGAGGAG 1165
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim 5; Page 95-96; 159pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Escherichia, Mycobeterium, Salmonella, Shigella and Staphylococcus. Escherichia, Mycobeterium, Salmonella, Shigella and Staphylococcus. The method may also be used for the identification of viruses, especially hepatitis C virus and simian immunodeficiency virus. Thermus aquaticus (Taq) DNA polymerase was amplified using two primers (AAT27679, AAT27680). The Taq polymerase DNA was inserted into the BamHI restriction site of the expression vector pET-3c and mutant genes were created from that construct. This mutant was created after the vector was digested with BstXI and BamHI. The DNA was then treated with the Klenow fragment of DNAPEcl to trim both 3' overhangs to blunt ends which were then ligated togethor, resulting in an in frame deletion of 903 nucleotides. The resulting mutant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Cleavage of nucleic acids using an enzyme, especially a nuclease selected from the group consisting of Cleavase (RTM) BN enzyme, Thermus aquaticus DNA polymerase, Thermus thermophilus DNA polymerase, Escherichia coli ExoIII and the Saccharomyces cerevisiae

This sequence was derived from the mutTag construct described in AAT70343. The entire mutTag gene was cut from the plasmid, and cloned into pET-3c. This clone was digested with BstXI and BamHI, at unique
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     sites. The 3' overhang of BstXi was trimmed to a blunt end, while the 5' overhang of BsmH! was filled in. The blunt ends were lighted together. This resulted in an in-frame deletion of 903 nucleotides. The enzyme encoded by the present protein is also referred to as Cleavase BB.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Thermostable 5' nuclease derived from thermostable polymerase - has

cc altered Thermus aquaticus DNA polymerase (Taq) gene in which cc altered Thermus aquaticus DNA polymerase (Taq) gene in which cc nucleotides 875-1778 of the wild-type gene coding sequence are cd eleted. Mutant gene mutTaq (see AAT76643) was used as the starting cc material for the construct. Cleavase BB is a thermostable cc structure-specific nuclease preferred for use in nucleic acid cc leavage methods of the invention. Mutant genes (AAT7644-47) cc were constructed in order to determine which portions of the Taq cc were constructed in order to determine which portions of the Taq cc polymerase domain can be altered without eliminating 5' nuclease cc polymerase domain can be altered without eliminating 5' nuclease cc activity. The invention relates to means for the detection and cc characterisation of nucleic acid (NA) sequences and variations in the structure on the structure of the specific manner. The 5' nuclease activity of various enzymes cc (see AAN4/210-13) is used to cleave the target dependent cleavage structure, thereby indicating the presence of specific NA sequences cc or specific variations of them.
